

Introduction

This document demonstrates multi-column markdown rendering in phppdf. The text flows from the first column into the second column seamlessly.

Features

Column layout supports markdown content including headings, paragraphs, and bullet lists. The cursor advances automatically when a column is full.

- Item one: fast column-aware layout engine
- Item two: automatic page break when all columns are full
- Item three: compatible with all standard markdown constructs

Conclusion

The multi-column layout works correctly for single-page documents where the total content fits within two columns on one A4 page.
